

# AI Is Entering Credit Unions. Govern It.

## The AI Operating System for Regulated Finance.

### Confidence

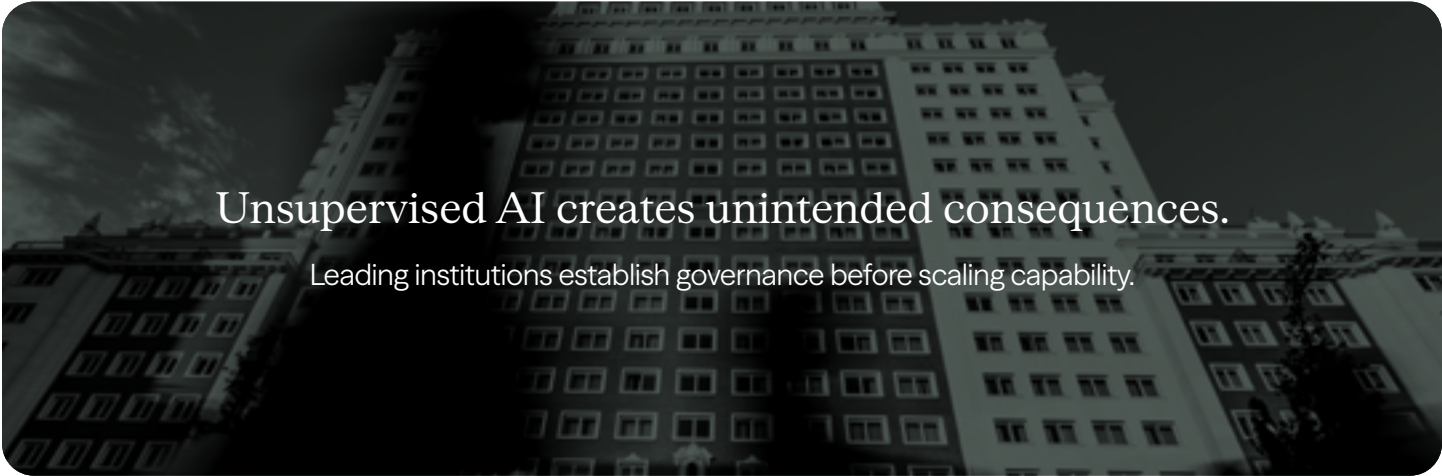

Adopt advanced capability within guardrails aligned to member protection

### Cohesion

Connect data, workflows, and service channels through one controlled layer

### Control

Keep proprietary member information inside cooperative boundaries

## Unsupervised AI creates unintended consequences.

Leading institutions establish governance before scaling capability.

### Safety & Governance

- Policy-driven supervision
- Full traceability
- Compliance-aligned architecture
- No external exposure

### Future-proof by Design

- Regulated workflow AI agents
- Continuous platform improvement
- Existing system integration
- Scales without disruption

### Competitive Edge

- Increase staff capacity safely
- Standardize service quality
- Reinforce operational discipline
- Personalize member experience

### The Problem

Most AI tools operate beyond internal visibility. That creates supervision gaps, audit blind spots, and regulatory exposure. The real danger is unmanaged use. Unsupervised AI scales exposure as fast as it scales capability.

### The Difference

Verapath is a deployable platform purpose-built for regulated finance. It installs governance architecture inside your environment. Intelligence becomes a governed operating discipline rather than an unmanaged disjointed toolset.

**Intelligence in regulated finance must be governed to be trusted.**

What system controls AI inside your credit union?
